

## Why Use DVD Ripper?

### Why use DVD Ripper?

DVD also is called "Digital Versatile Disc" or "Digital Video Disc", it is a popular optical disc storage media format. Its main uses are video and data storage.

A DVD ripper is a software program that facilitates copying the content of a DVD to a hard disk drive. They are mainly used to transfer video on DVDs to different formats, to edit or back up DVD content, and for converting DVD video for playback on media players and mobile devices. Some DVD rippers include additional features, such as the ability to decrypt DVDs, remove copy preventions and make disks unrestricted and region-free.

### The following is the main use of DVD rip software or DVD Ripper

- \* To watch DVD movies on other MP3/MP4 players like iPod, touch, iPhone, etc.
- \* To share DVD movies with friends online
- \* To protect DVD disc from scratches
- \* And more...

### Why can't I copy DVD to my hard drive or put on players?

Almost all movies are encrypted with CSS copy protection. Decryption keys are stored in the normally inaccessible lead-in area of the disc. You'll usually get an error if you try to copy the contents of an encrypted DVD to a hard drive. However, if you have used a software player to play the movie it will have authenticated the disc in the drive, allowing you to copy without error, but the encryption keys will not be copied. If you try to play the copied VOB files, the decoder will request the keys from the DVD-ROM drive and will fail. You may get the message "Cannot play copy-protected files".

### How to Use DVD Ripper to copy DVD to hard drive or rip and convert DVD movies to other video format files?

DVD ripper software is the best dvd rip software to copy DVD to computer hard drive or convert DVD movie to other video file formats for personal use.
